## WHAT IS CLAIMED IS:

1	<ol> <li>A method for a data communications system, the method comprising:</li> </ol>
2	transmitting data in a transport overhead field to at least one network element,
3	the data providing a source identifier and a destination identifier; and
4	using the data in the transport overhead field to provide end-to-end services.

- The method of claim 1 wherein the transport overhead field is a J1
   field in a SONET communication packet.
- 1 3. The method of claim 2 wherein the J1 field includes the source 2 identifier and the destination identifier.
  - The method of claim 1 further comprising:
     applying a routing protocol to read the source identifier and the destination identifier.
  - The method of claim 1 wherein the end-to-end services include one or more of routing, provisioning and restoration of functions.
  - The method of claim 1 wherein the end-to-end services are path-level services of a SONET communications network.
  - The method of claim 1 wherein the method is performed in a communication circuit disposed in one of a synchronous optical network (SONET) and a Synchronous Digital Hierarchy (SDH).
  - The method of claim 7, wherein the communication circuit is implemented as a line card.
- 1 9. The method of claim 7 wherein the communication circuit is a protocol processor.

1

1	10.	The method of claim 1 wherein the data further includes one or more			
2	of transport identification data (TID), Internet Protocol (IP) addresses, Common				
3	Language Location Information (CLLI) data, and requests for bandwidth.				
1	11.	The method of claim 1 wherein the data providing the source identifier			
2	and the destination identifier avoid manual point-by-point routing of STS-Ns.				
1	12.	The method of claim 1 further comprising:			
2	applying a wavelength routing protocol to the data in the transport overhead				
3		field to provide end-to-end services, the wavelength protocol locating			
4		new paths for communication.			
		-			
1	13.	The method of claim 12 wherein an intelligent routing software system			
2	in combinatio	on with the wavelength routing protocol determines end-to-end routing			
3	automatically	•			
1	14.	The method of claim 12 wherein the wavelength protocol locating new			
2	paths for communication is implemented manually.				
1	15.	An apparatus disposed in a communication system, the apparatus			
2	comprising:				
3	means	s for transmitting data in a transport overhead field to at least one			
4		network element, the data providing a source identifier and a			
5		destination identifier; and			
6	means	for using the data in the transport overhead field to provide end-to-end			
7		services.			

- The apparatus of claim 15 wherein the transport overhead field is a J1 field in a SONET communication packet.
- 1 The apparatus of claim 16 wherein the J1 field includes the source
  2 identifier and the destination identifier.

1	18.	The apparatus of claim 15 further comprising:		
2	means	for applying a routing protocol to read the source identifier and the		
3		destination identifier.		
1	19.	The apparatus of claim 15 wherein the end-to-end services include one		
2	or more of rou	ating, provisioning and restoration of functions.		
1	20.	The apparatus of claim 15 wherein the end-to-end services are path-		
2	level services of a SONET communications network.			
l	21.	The apparatus of claim 15 wherein the apparatus includes a		
2	communication circuit disposed in one of a synchronous optical network (SONET)			
3	and a Synchro	onous Digital Hierarchy (SDH).		
1	22.	The apparatus of claim 21 wherein the communication circuit is		
2	implemented as a line card.			
1	23.	The apparatus of claim 21 wherein the communication circuit is a		
2	protocol processor.			
1	24.	The apparatus of claim 15 wherein the data further includes one or		
2	more of transport identification data (TID), Internet Protocol (IP) addresses, Common			
3	Language Loc	cation Information (CLLI) data, and requests for bandwidth.		
1	25.	The apparatus of claim 15 wherein the data providing the source		
2	identifier and the destination identifier avoids manual point-by-point routing of STS-			
3	Ns.			

overhead field to provide end-to-end services, the wavelength protocol locating new paths for communication.

means for applying a wavelength routing protocol to the data in the transport

The apparatus of claim 15 further comprising:

26.

1

2 3

1

1

2

3

4

- 1 27. The apparatus of claim 26 wherein an intelligent routing software 2 system in combination with the wavelength routing protocol determines end-to-end 3 routing automatically.
- 28. The apparatus of claim 26 wherein the wavelength protocol locates 2 new paths for communication manually.
  - 29. A computer program product for communication, the computer program product comprising: signal bearing media bearing programming adapted to transmit data in a transport overhead field to at least one network element, the
- 5 data providing a source identifier and a destination identifier; and 6 use the data in the transport overhead field to provide end-to-end services.
